

Applet

This version of the emulator includes an applet version of the emulator to be embedded in a webbrowser.

Big thanks goes to Bob Fludder at <http://www.businessvision.au> for testing and helping with this. He is suppose to write a how to and/or deployment for the applet version of the emulator.

Note:

Help is needed here with information and or changes to the code to allow a seamless integration. There are probably bugs in there so please be nice when reporting them :-)

1 Tested Browsers

Netscape

Internet Explorer

Konqueror - Linux KDE Desktop

2 Tested Plugins

- 1.3.1
- 1.4

One thing about the 1.4 plugin is that it allows a signed jar to be loaded and the proper authority is prompted for the certificate. Once accepted the certificate is then saved thus saving the deployment, installation and importing of keys/signatures to each of the desktops. Very Very nice.

3 Deployment

There are three applet files that are included:

- My5250App.html
- My5250AppPlugin.html
- My5250SSLindex.php

For signing of applets I am going to have to refer you to the experts at the discussion forum

of sun at the following: <http://forum.java.sun.com/thread.jsp?forum=63&thread=174214>

This has the best information on signing and deploying applets. This being my first applet program I am at a lost for help on deployment for the different browsers and I do not have the time to test them all.

Note:

Help is needed here with information and or changes to the code to allow a seamless integration. There are probably bugs in there so please be nice when reporting them ;-)

4 Applet Parameters

All command line options are supported for applet parameters except for the -f argument for file properties. Looking for suggestion here!!!!!!!

5 Live Demo Applet

First you will need to set up the java policy file for applet access. Instructions can be found [here](#)

You can try out a live demo [here](#)

If you have any questions or suggestions please let me know. If you have code changes PLEASE PLEASE send them to me.
